

FOR IMMEDIATE RELEASE

June 15, 2007

Additional results from Hole 27 yield high-grade interval of 0.189% Molybdenum over 17.34m.

BCM Resources Corporation (TSX-V: B). Additional assay results have identified a high-grade molybdenum interval at the bottom of Hole 27 (from 407.25m to 424.59m) of the Shan drill program. The hole was terminated in high-grade ore.

Hole 27 ended in what appears to be mineralization of a pre-ore fault zone. The highly mineralized nature of the fault zone was not recognized at the time due to abundant grey fault gouge and brecciation.

The following table details the significant higher grade intercepts in Hole 27:

Table of Intercepts					
Hole	From	To	Width (m)	Grade % Mo	
LM027*	111.8	302.4	190.6	0.103	
including	111.8	217.5	105.7	0.119	
including	190.6	217.5	26.87	0.168	
including	268.8	272.3	3.45	0.247	
including	288.0	302.4	14.5	0.362	
New Interval	407.3	424.6	17.3	0.189	

* Previously reported

All assays reported in this release were carried out at Acme Analytical Laboratories in Vancouver, B.C. Standards, blanks and duplicate samples were systematically submitted to the lab for QA/QC.

Qualified Person

Daryl Hanson, P.Eng., a Qualified Person as defined in NI 43-01, has reviewed the technical content of the drill program and previously reported results but not this news release.
